VILLUM FONDEN

The setting: concurrent and distributed systems

- Multiple things happening at the same time.
- Processes and resources at (possibly) different locations.
- Emergent behaviour.

A photograph of a group of people in a modern restaurant setting. In the foreground, two large, silver-colored service robots with blue glowing accents and touchscreens on their heads are positioned on a light-colored tiled floor. One robot is on the left, facing a group of people at a dark wooden table. A speech bubble originates from this robot, containing the text "Excuse me, I need to come through.". Another robot is on the right, facing another group of people. In the background, several people are seated at tables, some looking towards the robots. The restaurant has a warm, contemporary interior with bamboo elements and large windows.

Excuse me, I
need to come
through.

PLEASE DO NOT PUT ANYTHING ON THE ROBOT

STIL VENLIGST IKKE NOGET PÅ ROBOTTEN

A distributed program

Code for a

```
recv x from c;
if valid(x) {
    send OK to ws;
} else {
    send KO to ws;
}
```

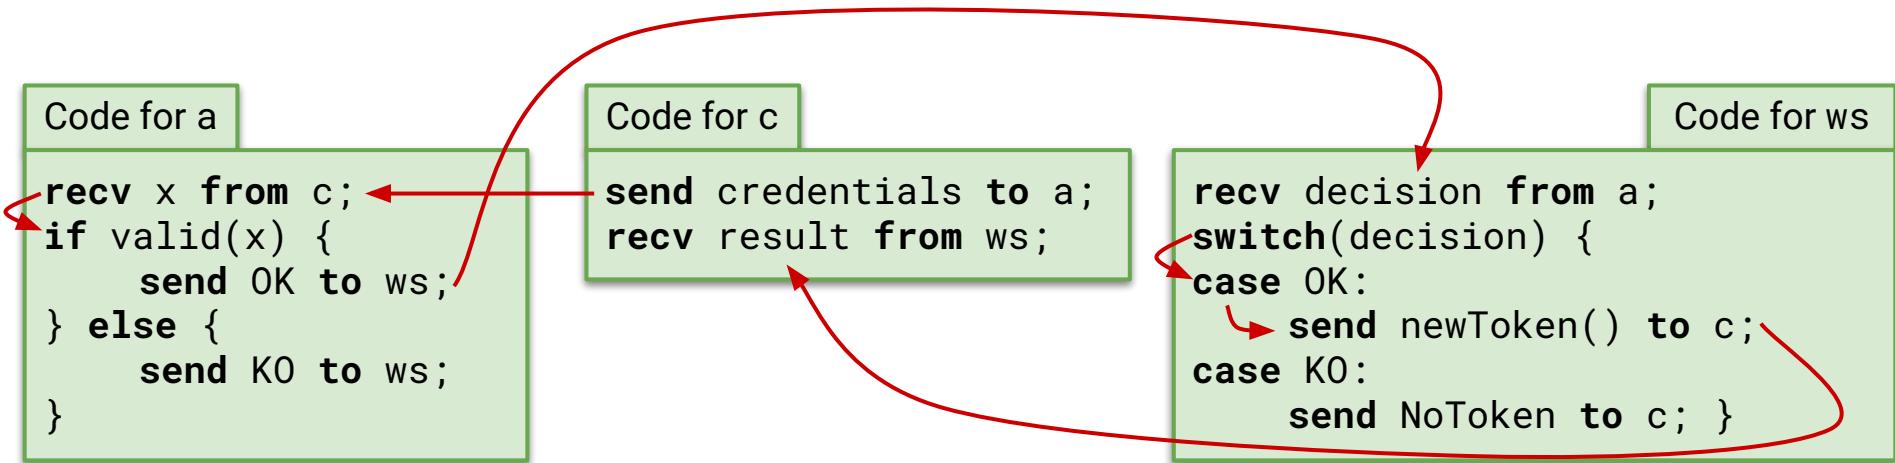

Code for c

```
send credentials to a;
recv result from ws;
```

Code for ws

```
recv decision from a;
switch(decision) {
case OK:
    send newToken() to c;
case KO:
    send NoToken to c; }
```

A distributed program

Chor

```
client.msg -> server.x : hi(k);  
show@server(msg);
```

Screenshot of the Eclipse IDE interface for Chor. The title bar says "Java - tutorial/authentication.chor - Eclipse SDK". The left side shows the "Package Explorer" with files like "tutorial.che", "authentication.che", and "tutorial.chr". The main editor area contains Chor code:

```
program authentication;

protocol AuthenticationProtocol {
    U -> RP: username[ string ];
    RP -> IP: username[ string ];
    U -> RP: password[ string ];
    IP -> RP: 
        ok[ void ];
        fail[ void ];
    }
}

public publicAuthChannel : AuthenticationProtocol;

main
{
    u[U] start rp[RPI], ip[IP] : publicAuthChannel{ authSession };
    ask[u] "[u] Username?", username ;
    ask[u] "[u] Password?", password ;
    u.username -> rp.username : username{ authSession };
    rp.username -> ip.username : username{ authSession };
    u.password -> ip.password : password{ authSession };
    ask[RP] "[ip] Accept? " + username + " / " + password, result ;
    if result == "yes" then p
}
```

The right side shows a tree view of protocol components: "authentication", "u", "rp", "ip", "authSession", "u", "username", "password", and "p".

Chor

```
client.msg -> server.x : hi(k);  
show@server(msg);
```

A screenshot of the Eclipse IDE interface. The title bar says "Java - tutorial/authentication.chor - Eclipse SDK". The left side shows the "Package Explorer" with files like "tutorial.chor", "authentication.chor", and "tutorial.chr". The main workspace displays Chor code for an authentication protocol. The code defines a protocol "AuthenticationProtocol" with messages for user login and password exchange. It also includes a "publicAuthChannel" and a "main" function that starts the protocol. The right side of the interface shows the "Outline" view, which lists various components and their details.

```
program authentication;

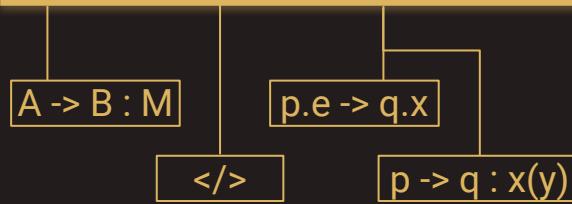

protocol AuthenticationProtocol {
    U -> RP: username(string);
    RP -> IP: username(string);
    U -> RP: password(string);
    IP -> RP: 
        ok(void),
        fail(void)
}

public publicAuthChannel : AuthenticationProtocol;

main
{
    u[U] start rp[RP], ip[IP]: publicAuthChannel(authSession);
    ask[u] "[u] Username?", username;
    ask[u] "[u] Password?", password;
    u.username -> rp.username : username(authSession);
    rp.username -> ip.username : username(authSession);
    u.password -> ip.password : password(authSession);
    ask[RP] "[ip] Accept?" + username + "/" + password, result;
    if(result == "yes") ip();
}
```

Choreographic Programming Languages

- ★ Locality.
- ★ Objective viewpoint.
- ★ Interaction abstraction.

Translational Questions

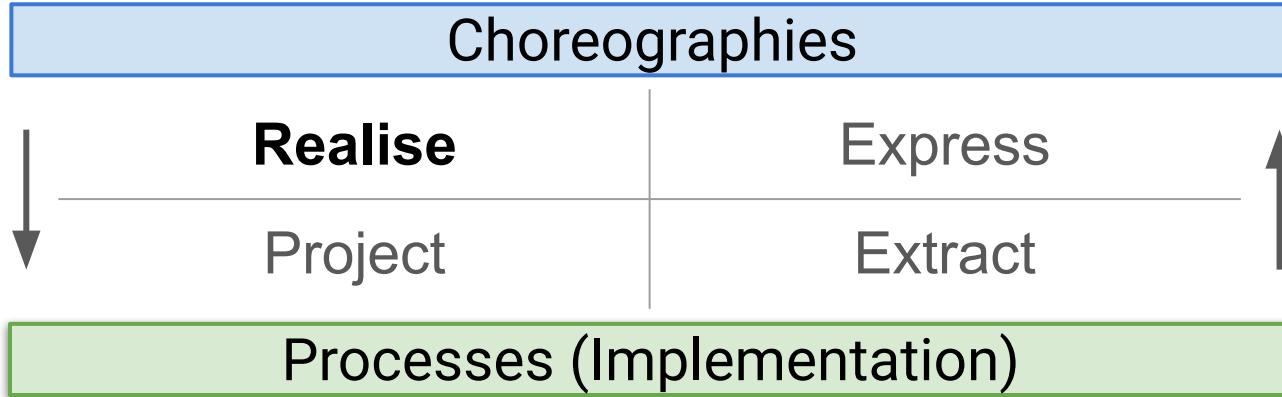

Translational Questions

Realisability (of a choreography):
There exists an implementation.

Translational Questions

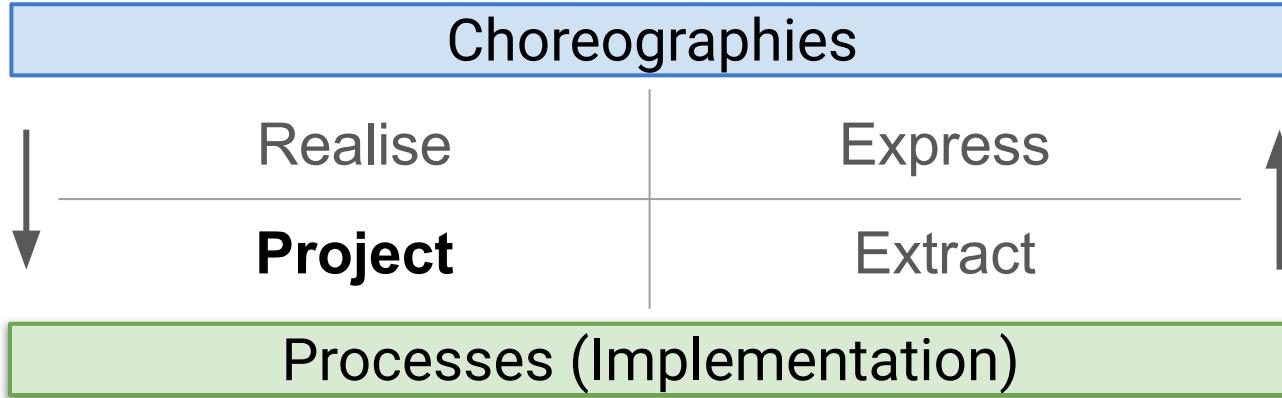

Realisability (of a choreography):

There exists an implementation.

```
if a.valid(x) {  
    ws.newToken() -> c.result;  
} else {  
    ws.NoToken -> c.result;  
}
```

Translational Questions

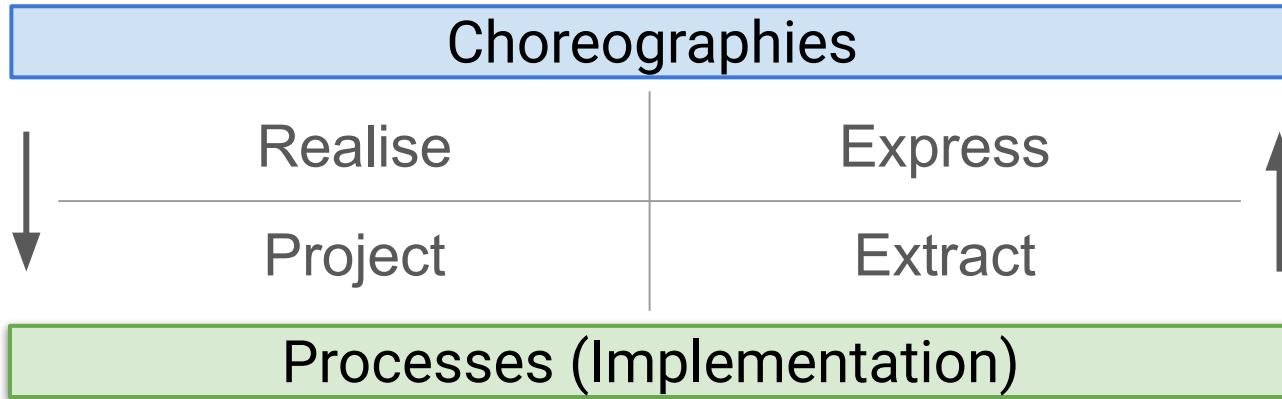

Realisability (of a choreography):

There exists an implementation.

Projectability (of a choreography):

We can compute an implementation.

Translational Questions

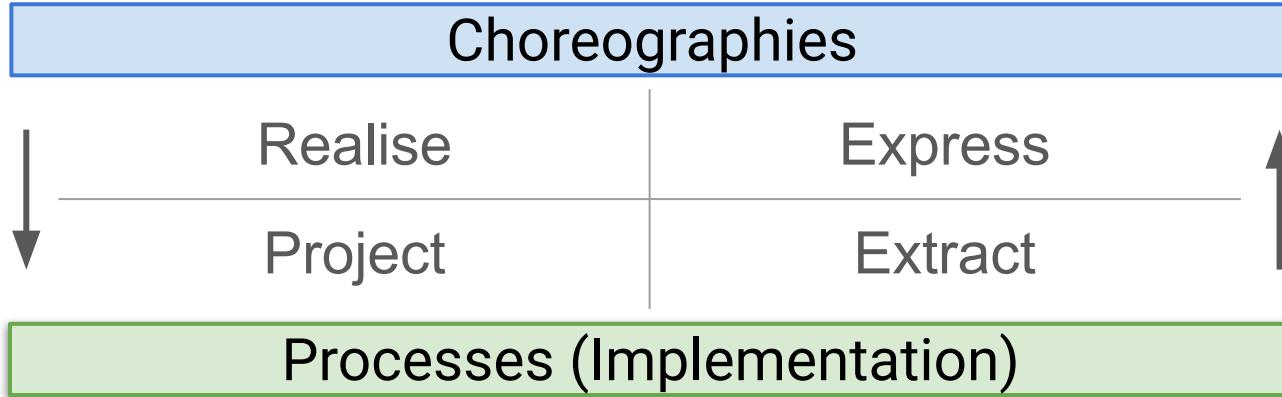

Amendment:

The transformation of a choreography into a projectable one.

```
if a.valid(x) {  
    ws.newToken() -> c.result;  
} else {  
    ws.NoToken -> c.result;  
}
```

Translational Questions

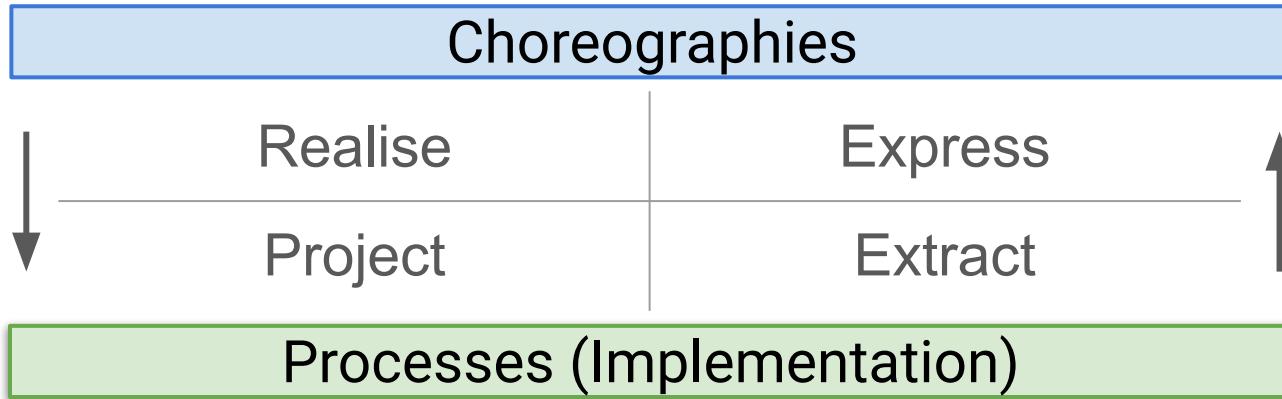

Amendment:

The transformation of a choreography into a projectable one.

```
if a.valid(x) {  
    ws.newToken() -> c.result;  
} else {  
    ws.NoToken -> c.result;  
}
```

Translational Questions

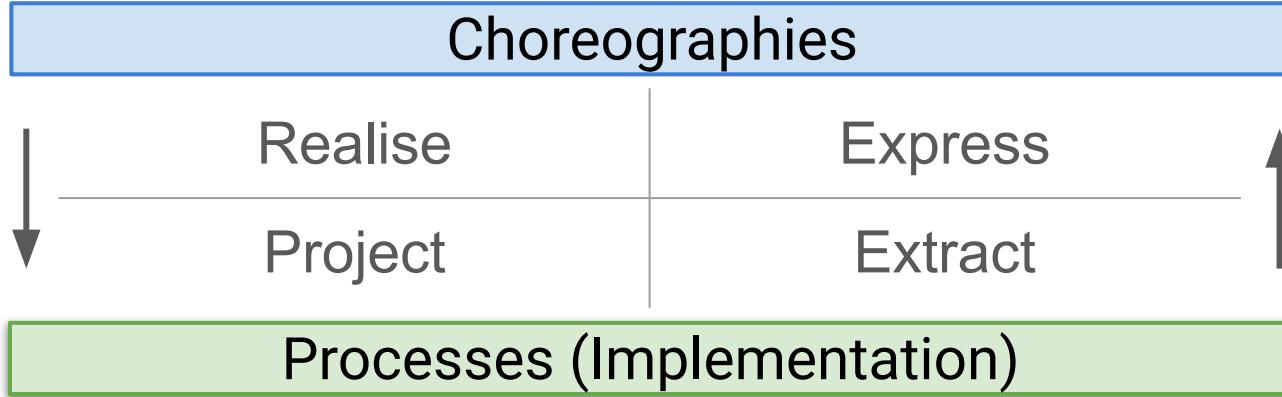

Amendment:

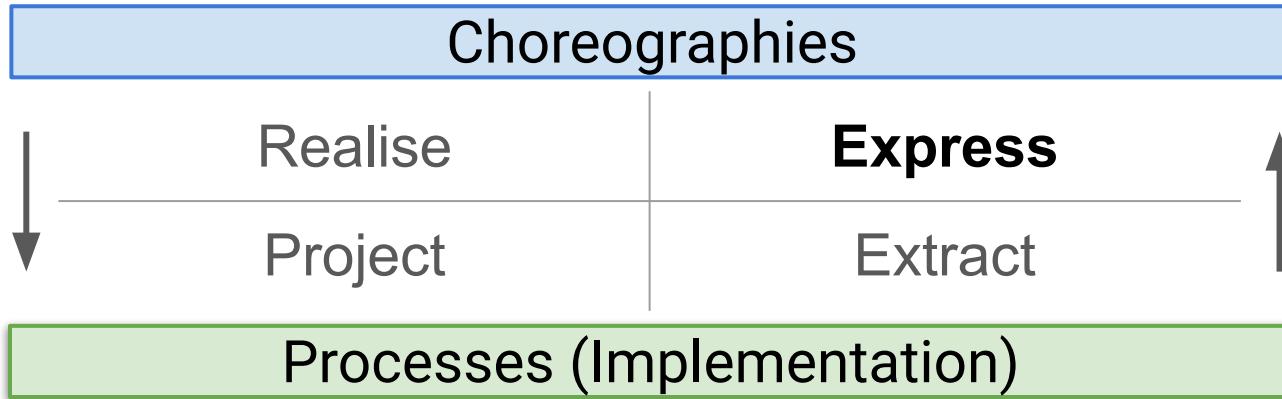

The transformation of a choreography into a projectable one.

```
if a.valid(x) {  
    a.OK -> ws.decision;  
    ws.newToken() -> c.result;  
} else {  
    a.K0 -> ws.decision;  
    ws.NoToken -> c.result;  
}
```

Translational Questions

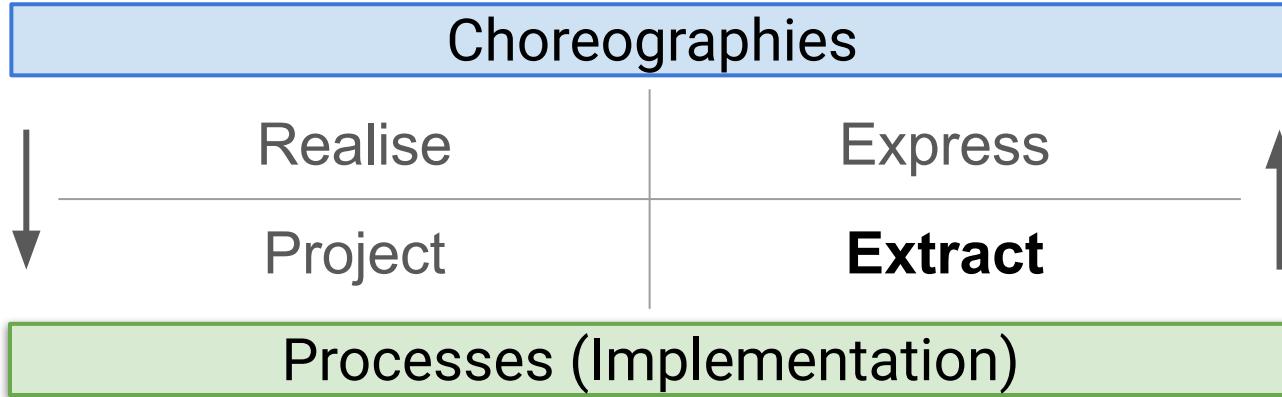

Translational Questions

Expressivity:

Can we write a choreography of a given implementation?

Translational Questions

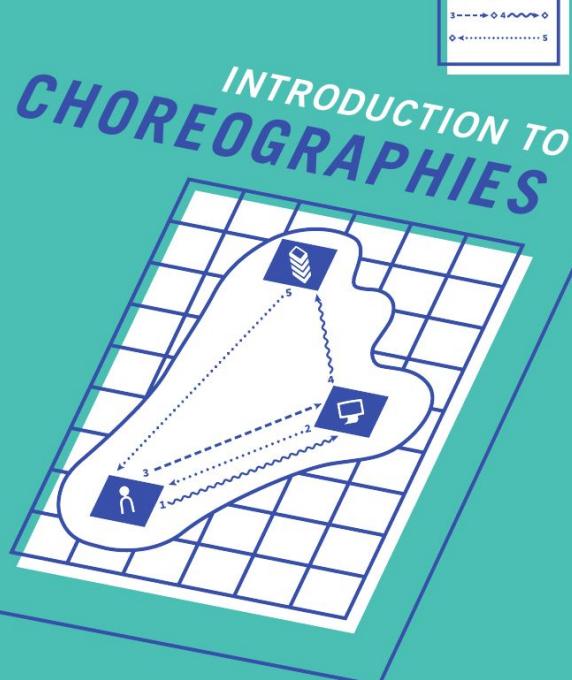

Expressivity:

Can we write a choreography of a given implementation?

Extraction:

Can we compute a choreography of a given implementation?
